Assistant: "mHealth apps: Any hopes for the illiterate and semi illiterate?"

**Beschreibung:**
In the current era where mobile technology is being utilized in health care to improve service delivery, researchers and developers have mainly focused on developing applications that are more usable by people who can read and write. This leaves an unanswered question as to what happens to the illiterate and semi illiterate mainly in developing countries who are unable to use the available applications.

In the course of this thesis, requirements for an mHealth application that supports multimedia functions such as video, audio, text and images will be gathered and a prototype of the mobile application that supports maternal healthcare and is usable by illiterate and semi-illiterates will be developed and tested.

**Anforderungen:** The thesis will be done in English, therefore high proficiency of English is required.

Knowledge of programming applications for low end mobile devices is an added advantage.
